

PHIL

PERSONAL HEALTH INTELLIGENCE LAYER

STATUS

Functional concept

Fictional data only

PATIENT-CONTROLLED HEALTH CONTEXT

Your health is not fragmented. Your health data is.

PHIL turns scattered health information and lived experience into a clear, source-aware brief for a better clinical conversation.

THE OPPORTUNITY

Health information is stored by source, while the patient carries the connections among symptoms, routines, records, access, and what life can realistically hold. PHIL explores whether better preparation can make that story more usable before a scheduled visit.

THE PROPOSED WORKFLOW

- 01 Gather the fragments**
Patient story, records, routines, and practical constraints.
- 02 Make patterns visible**
Place events in sequence without claiming causation.
- 03 Prepare the conversation**
The patient chooses priorities and visit questions.
- 04 Keep judgment human**
Verify sources, uncertainty, and the approved version.

WHAT I BUILT

- Responsive six-view interactive prototype
- Whole-person Context Map and source ledger
- Health Timeline with an uncertainty boundary
- Patient-controlled Visit Preparation Brief
- Human verification gate and decision record
- Published method, safety, case, and review protocol

EVIDENCE STATUS

- | | |
|-----------|-----------------------------------|
| BUILT | Public artifact and documentation |
| FICTIONAL | Persona, history, and records |
| PENDING | Need and practitioner validation |

SAFETY BOUNDARY

PHIL does not diagnose, prescribe, interpret results, recommend medication or supplements, assess urgency, or replace care. The public prototype collects no personal health information.
